5. A short reflection of 3–5 sentences answering:

- What was the most difficult part?
 - i. Joining the lakebase tables to the application and making sure the app could properly read and write data. Also, navigating creating the app as I am a Data Engineer and have not created an app since a very long time.
- How is Lakebase different from storing this data in a traditional analytics table?
 - i. Lakebase is built for real-time transactional use cases, where changes are immediately saved and available to the application. Traditional analytics tables are mainly used for reporting and analysis and are not designed for frequent record updates.
- What feature would you add next?
 - i. The next feature I would add is user authentication and role-based access control so customers and support team members can have different levels of access.
